# python ecosystem

MicroPython is a lean and fast implementation of the Python 3 programming language that is optimised to run on a microcontroller. MicroPython was successfully funded via a Kickstarter campaign and the software is now available to the public under the MIT open source license. It ensures that the memory size/microcontroller performance is optimised and fit for purpose for the application it serves. Many sensor reading and reporting applications do not require a PC based processor as this would make the total application over priced and under-efficient.

# micropython options

The MicroPython **pyboard** is a compact electronic circuit board that runs MicroPython on the bare metal, giving you a low-level Python operating system that can be used to control all kinds of electronic projects.

MicroPython is packed full of advanced features such as an interactive prompt, arbitrary precision integers, closures, list comprehension, generators, exception handling and more. Yet it is compact enough to fit and run within just 256k of code space and 16k of RAM.

MicroPython aims to be as compatible with normal Python as possible to allow you to transfer code with ease from the desktop to a microcontroller or embedded system.

# pyboard

## MicroPython pyboard feature table

### BOARD

description	The original pyboard v1.1	Pyboard lite v1.0 with accelerometer	Pyboard lite v1.0
SKU	PYBv1.1	PYBLITEv1.0-AC	PYBLITEv1.0

### PRICE

GBP incl. tax	£28.00	£22.60	£19.60
approx EUR incl. tax	€39.20	€31.60	€27.40
approx USD excl. tax	\$35.00	\$28.25	\$24.50

### MICROCONTROLLER

MCU	STM32F405RGT6	STM32F411RET6	STM32F411RET6
CPU	Cortex-M4F	Cortex-M4F	Cortex-M4F
internal flash	1024k	512k	512k
RAM	192k	128k	128k
maximum frequency	168MHz	96MHz	96MHz
hardware floating point	single precision	single precision	single precision

## BOARD FEATURES

micro USB connector	yes	yes	yes
micro SD card slot	yes	yes	yes
accelerometer (MMA7660)	yes	yes	no
real time clock	32kHz crystal	internal oscillator; pads to solder 32kHz crystal	internal oscillator; pads to solder 32kHz crystal
switches	USR+RST	USR+RST	USR+RST
leds	R+G+Y+B	R+G+Y+B	R+G+Y+B
hobby servo ports	4	4	4
DFU mode for firmware upgrade	yes	yes	yes

## POWER SUPPLY

supply options	USB/V+/VBAT	USB/V+/VBAT	USB/V+/VBAT
input range on V+/VBAT	3.6v-16v	3.6v-16v	3.6v-16v
max output of regulated 3.3v	250mA	250mA	250mA
place for JST connector	yes	yes	yes
backup battery input (VBACK)	yes	yes	yes

## POWER CONSUMPTION

running at 168MHz	56mA	-	-
running at 96MHz	37mA	23mA	23mA
running at 48MHz	21mA	13mA	13mA
idling at 168MHz	16mA	-	-
idling at 96MHz	12mA	5mA	5mA
idling at 48MHz	7mA	4mA	4mA
sleep (full RAM retention)	360uA	180uA	180uA
deepsleep (backup retention only)	6uA	6uA	6uA

## IO CAPABILITIES

IO pins	30	30	30
pins with PWM	20	18	18
pins with A/D	16 (4 shielded)	16 (4 shielded)	16 (4 shielded)
pins with D/A	2	0	0

## PERIPHERALS

independent timers	13	7	7
hardware random number generator	yes	no	no
UART	5	3	3
I2C	2	2	2
SPI	2	2	2
CAN	2	0	0

## MICROPYTHON

### CAPABILITIES

internal flash fs	112k (94k usable)	64k (46k usable)	64k (46k usable)
approx heap size	100k	83k	83k

### ADD-ONS

LCD+touch skin compatible (LCD32MKv1.0)	yes	yes	yes
Audio skin compatible (AMPv1.0)	yes	no	no

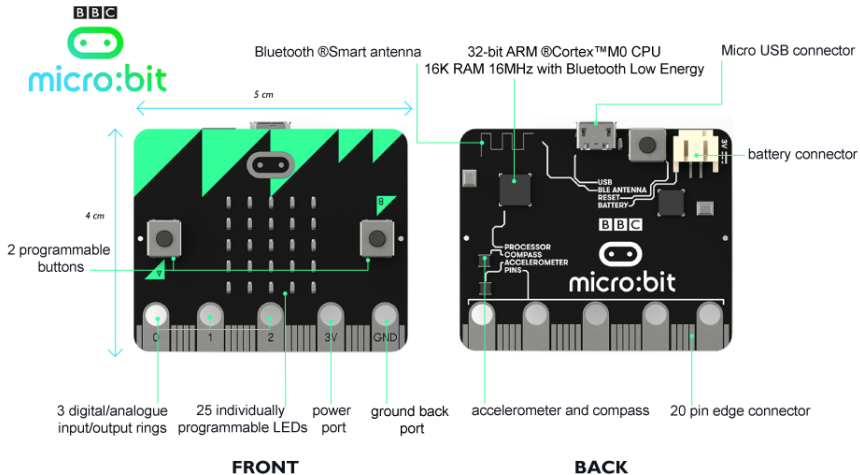

## ESP8266: low cost

## ESP8266: characteristics

- 802.11 b/g/n
- Built-in TCP / IP protocol stack
- Built-in PLL, voltage regulator and power management components
- 802.11b mode + 19.5dBm output power
- Built-in temperature sensor
- off leakage current is less than 10uA
- Built-in low-power 32-bit CPU: can double as an application processor
- SDIO 2.0, SPI, UART
- standby power consumption of less than 1.0mW

# BBC Micro:bit

The Micro Bit is an ARM-based embedded system designed by the BBC for use in computer education in the UK.

The board has an ARM Cortex-M0 processor, accelerometer and magnetometer sensors, Bluetooth and USB connectivity, a display consisting of 25 LEDs, two programmable buttons, and can be powered by either USB or an external battery pack. The device inputs and outputs are through five ring connectors that are part of the 23-pin edge connector.

# Trinket

- Espressif ESP32 chipset
- Dual processor + WiFi radio system on chip
- consuming 25uA
- 2 x UART, 2 x sPI, I2C, I2S, micro SD card
- Analog channels: 8x12 bit ADCs
- Hash/Encryption: SHA, MD5, DES, AES
- Bluetooth
- Memory, RAM: 512KB, External flash: 4MB
- Hardware floating point acceleration

# pycom: LoPy

## pycom: Expansion Board

- Ambient light sensor
- Barometric pressure sensor
- Humidity sensor
- 3 axis 12-bit accelerometer
- Temperature sensor
- USB port with serial access
- LiPo battery charger
- MicroSD card compatibility
- Ultra low power operation ( 1uA in deep sleep)

- GNSS + Glonass GPS
- 3 axis 12-bit accelerometer
- USB port with serial access
- LiPo battery charger
- MicroSD ard compatibility
- Ultra low power operation ( 1uA in deep sleep)

## Plan of the week

---

# plan for the week

During the lab sessions we will cover:

1. Pycom workflow
2. Hello World for IoT: LED switching
3. Saving data to a microSD or to internal flash
4. Reading sensors using the PySense
5. Reading position using the PyTrack
6. Connecting to WiFi and measuring the signal strength
7. Using MQTT
8. Using LoRaWAN
9. Project presentation

You will have simple code snippets and will develop more complex code as exercise.

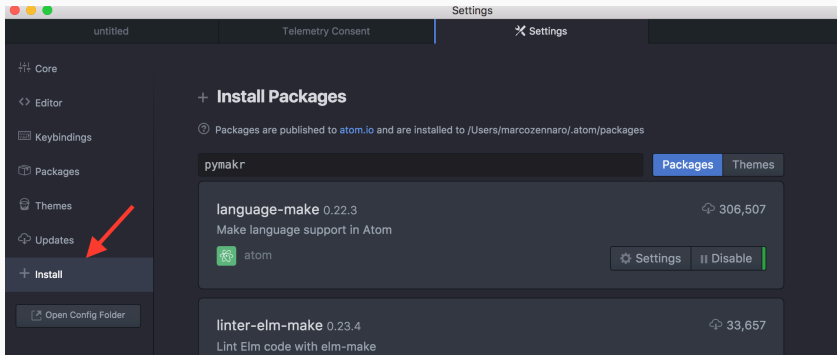

# workflow: Atom

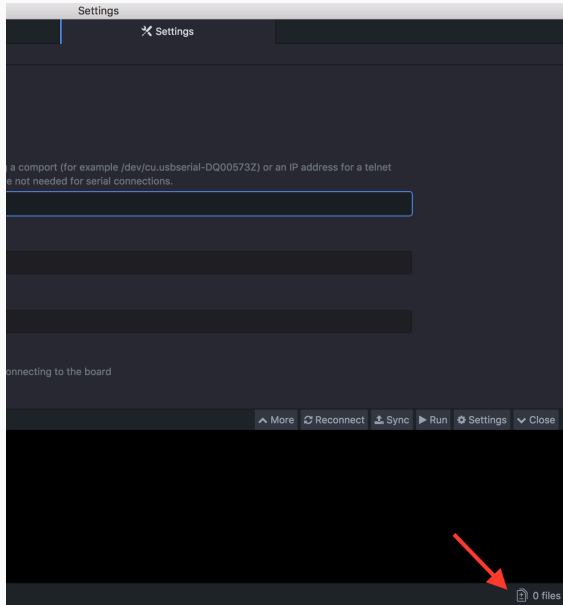

Please install Atom from

[www.atom.io](http://www.atom.io)

# workflow: install the pymakr package

# workflow: update packages if necessary

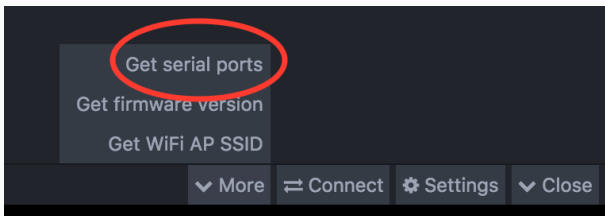

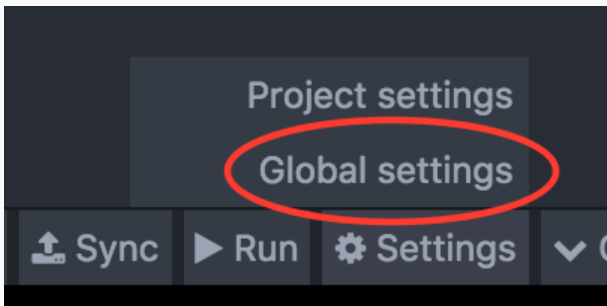

# workflow: connect board via USB

Make sure the LED and the microUSB are on the same side!

## workflow: get serial port

## ⚙ Settings

### Device address

Either connect through USB serial using a comport (for example `/dev/cu.usbserial-DQ00573Z`) or an IP address for a telnet connection. Username and password are not needed for serial connections.

```
/dev/cu.usbserial-DQ008H98
```

### User name

```
Default: micro
```

### Password

```
Default: python
```

# workflow: connect!

```
Connected ✓  
Found 3 serialports  
/dev/cu.usbserial-DQ008N17 (copied to clipboard)  
/dev/cu.MarcosiPad-WirelessiAP  
/dev/cu.Bluetooth-Incoming-Port  
Connecting on /dev/cu.usbserial-DQ008N17...  
>>>  
>>>  
>>>  
>>>  
>>>
```

REPL stands for Read Print Eval Loop. Simply put, it takes user inputs, evaluates them and returns the result to the user.

You have a complete python console!

Try to enter `2+2` and press Enter.

Now enter:

```
print("Hi! I am a python shell!")
```

There are three ways to execute code on a Pycom device:

1. Via the REPL shell. Useful for single commands and for testing.
2. Using the Run button. Code in the Atom editor will be executed, but will not be stored in the device. If you reboot, the code will not be executed again.
3. Syncing the device with the Project folder in Atom.

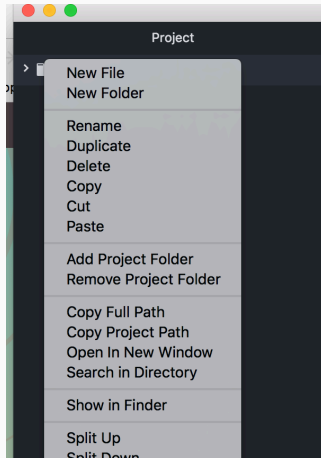

## workflow: Run

## workflow: add Project folder

## workflow: ONE Project folder

It is easier if you only have one Project folder. Make sure you Remove any other Project folders and keep only the one you want to use.

The Project folder should contain all the files to be synched with the device.

You should always have two files: **boot.py** (executed at boot time) and **main.py** (containing the main code).

The folder can also include libraries and other python source code.

## workflow: example of Project folder

The boot.py file should always start with following code, so we can run our Python scripts over Serial or Telnet.

```
from machine import UART
import os
uart = UART(0, 115200)
os.dupterm(uart)
```

**LED**

---

In this example, we will create and deploy the proverbial 1st app, “Hello, world!” to a Pycom device.

The WiPy module has one LED (big, white LED on the same side as the microUSB).

Check the LED folder and sync the two files to your active project folder.

Try to send an SOS message using the LED. The SOS is line-line-line-dot-dot-dot-line-line-line in morse code, where a line is three times longer than a dot.
